

HandsMen Threads: Elevating the Art of Sophistication in Men's Fashion

PROJECT OVERVIEW

This project, entitled HandsMen Threads: Elevating the Art of Sophistication in Men's Fashion is an organization in the fashion industry that implements Customer Relationship Management (CRM) using the Salesforce platform. The company's processes will transform its operations in data management and customer relationships. As the brand expands, this project will be useful for handling customer profiles, tracking orders, personalized services, and maintaining data accuracy to minimize complexity and current challenges. As a result of these, the brand's commitment to improving customer satisfaction will be attained as the company will utilize the Salesforce CRM platform for a more reliable customer relationship management.

OBJECTIVES

The main goal of this Salesforce CRM project is to build not just customized and functional but to develop a reliable and scalable system that supports the daily operations of the business. With the use of this CRM, it will be useful to simplify data management by centralizing customer information, orders, and inventory into a one unified, organized, and dependable platform. In addition to this, minimizing errors will be preventable with the addition of automations, like order confirmations, low-stock alerts, loyalty updates, and scheduled batch jobs that will ultimately speeds up the business process with little to no errors.

These objectives help the business by providing:

- Better customer support with timely and automated communication.
- Faster and more efficient operations by reducing manual tasks.
- More accurate inventory tracking to prevent shortages and delays.
- Quicker order processing for smoother daily activities.
- Improved decision-making with real-time and consistent data.
- Higher customer satisfaction through personalized loyalty program updates.
- Room for long-term growth since the CRM can scale with the business.

PHASE 1: REQUIREMENT ANALYSIS AND PLANNING

Understanding Business Requirements

HandsMen Threads needs a CRM solution that solves both operational issues and customer engagement problems. Right now, users deal with manual order confirmations, inconsistent loyalty reward tracking, delayed stock notifications, and time-consuming bulk order updates. Another major requirement is keeping data accurate and consistent directly from the user interface (UI), so that every piece of information can be trusted for decision-making.

To address these needs, the system will automate important business processes: customers will automatically receive order confirmations, loyalty statuses will update based on their purchase history, the warehouse will be notified when stocks are running low, and bulk order updates will be handled through scheduled processes. Overall, these features aim to improve efficiency, reduce errors, and create a better experience for customers.

Project Scope and Objectives

The Salesforce CRM implementation for HandsMen Threads focuses on centralizing business data, automating key processes, and improving overall operational efficiency. The system will consolidate customer information, orders, and inventory into a single Salesforce platform, ensuring accurate and reliable data for everyday use. Core processes, such as order confirmations, loyalty tier updates (Bronze, Silver, Gold), low-stock alerts, and bulk order processing that will be automated to reduce manual work and prevent errors.

To support these features, Salesforce objects, fields, validation rules, and page layouts will be customized to match the company's workflow. Backend logic will be developed using Apex, triggers, and batch classes where declarative tools are not sufficient. The project also includes dashboards and reports for real-time insights, along with integrated email notifications to strengthen customer communication.

Overall, this CRM aims to maintain data accuracy directly from the UI, enhance customer satisfaction through timely automated updates, improve operational efficiency, support real-time inventory tracking, and ensure long-term scalability. Training for administrators and end users will also be conducted to ensure smooth adoption and sustained system usage.

Data Model

Figure 1 shows the Entity–Relationship Diagram (ERD) of the HandsMen Threads Salesforce CRM, showing how key business records connect within the system. Each customer can place multiple orders, and every order is linked to specific products. These products are tied to inventory records that track stock levels across different locations. Customers may also be associated with multiple marketing campaigns. This structured model supports organized, scalable, and efficient data management, allowing for accurate reporting, seamless workflow automation, and smooth integration across business processes.

Fig. 1. Entity Relationship Diagram of HandsMen Threads

Security Model

To ensure security within the HandsMen CRM platform, figure 2 illustrates a comprehensive security layer that would protect the CRM platform. The top layer includes role-based access control security, record-level security, and profile and permission sets. This will be the strongest protection against vulnerabilities, unauthorized access of data, broken access control. The middle layer would protect the CRM against input mistakes from the users and validates it. Lastly, the bottom layer tracks user activity and changes, while it doesn't prevent access, it provides accountability and the ability to detect nuances.

Fig. 2. Security Layers of HandsMen Threads CRM

Stakeholders Mapping

- CEO serves as the highest authority with full visibility and control over all CRM data and processes. Oversees strategic decisions and monitors overall system performance.
- Sales manager reports directly to the CEO and manages customer records, sales transactions, and order-related activities. Ensures data accuracy and smooth handling of customer and order information.
- Marketing manager also reports to the CEO, this team manages marketing campaigns, tracks customer engagement, and evaluates campaign performance within the CRM.

Fig. 2. Role Hierarchy of HandsMen Threads

PHASE 2: SALESFORCE DEVELOPMENT – BACKEND AND CONFIGURATIONS

Setup Environment and DevOps Workflow

The environment used is a special developer edition playground from Salesforce that has all the customization configurations for the project. All access has been granted for the project to work.

Customization of Objects, Fields, Validation Rules, Automation (Workflow Rules, Process Builder, Flow, Approval Process)

The following custom objects were created to facilitate the business operations of the HandsMen Threads:

1. **HandsMen Customer** – Stores the customer information details.
2. **HandsMen Order** – Stores the customer order details such as the product ordered, status (Pending, Confirmed, Rejected) and the total amount.
3. **HandsMen Product** – Stores the product details such as product name, SKU, price, and quantity.
4. **Inventory** – Stores the inventory details such as stock status, stock quantity, and the warehouse.
5. **Marketing Campaign** - Stores details such as customer name, start and end date.

Validation Rules

Below are the validation rules set out for HandsMen customer, order, and inventory.

Automation Flows

Record-Trigger Flows

- **Order confirmation flow** – Triggered when user changed the status field from pending to confirmed. An email will be sent to the customer about the confirmation.

- **Stock alert flow** – Triggered when the inventory stock quantity is less than 5. An email alert will also be sent to the inventory manager.

Schedule-Based Flow

- **Loyalty Status Flow** – This is scheduled automated flow that will send an alert to the customer informing their new loyalty status, either Bronze, Silver, or Gold, depending on their total purchase amount.

Apex Classes and Triggers

Apex classes were written to build the logic for SOQL and Apex triggers for addional triggers to update inventory stocks and error handlings.

- **OrderTotalTrigger** – triggers the total amount of the order automatically.
- **StockDeductionTrigger** – trigger the inventory stock to deduct once an order has been confirmed.
- **OrderTrigger** - This trigger automatically checks the quantity of items whenever an order is created or updated, ensuring only valid orders are saved.

PHASE 3: UI/UX DEVELOPMENT AND CUSTOMIZATION

Lightning App Setup through App Manager

A custom Lightning App is created to give users a streamlined and personalized workspace. Tabs, branding, and navigation are organized to make the interface clearer, easier to use, and visually consistent.

Page Layouts and Dynamic Forms

Page Layouts and Dynamic Forms are tailored to show only the most important fields and sections for each type of user. This creates a cleaner interface and helps users enter information quickly and efficiently.

PHASE 4: DATA MIGRATION, TESTING AND SECURITY

Profile and Roles

The system made use of Salesforce’s standard profiles, including Standard User and System Administrator, to define baseline access levels for different types of users. The System Administrator profile retained unrestricted permissions for configuring the CRM, managing data, and overseeing system maintenance. Meanwhile, users assigned to the Standard User profile were granted access only to the features and records necessary for their daily responsibilities. This approach enforced secure, structured access across the org while supporting efficient workflow for each department.

Role Hierarchy

- 1. **CEO** – Holds full visibility and access to all system data.
- 2. **Sales Team** – Reports to CEO. Manages customer information and order records.
- 3. **Marketing Team** – Reports to CEO. Overseas campaign activities and customer engagement data.
- 4. **Inventory Team** – Reports to CEO. Maintains product details, stock records, and inventory updates.

Permission Sets

- Sales manager has permission sets of Read, Create, Edit, and Delete to Customers and Orders.

PHASE 5: DEPLOYMENT, DOCUMENTATION AND MAINTENANCE

Development Strategy

All custom components, including objects, fields, automation, triggers, flows, and batch jobs were developed and configured within the primary Salesforce org. Each feature underwent individual testing to ensure accuracy, functional stability, and compatibility with existing processes. Since the work was performed in a single environment, deployment was simplified, reducing the risks associated with transferring metadata between orgs. Documentation of each component was maintained to support transparency and future enhancements.

Maintenance and Monitoring

Ongoing maintenance will involve periodic evaluations of flows, triggers, validation rules, and scheduled jobs to ensure they continue to perform efficiently as business processes evolve. System logs such as Debug Logs, Flow Error Logs, and Apex Job logs will be reviewed routinely to detect early signs of issues. Administrators will update user roles, permission sets, and page layouts when organizational changes occur, ensuring that system access and interface design remain aligned with operational requirements. Regular data clean-up and audit reviews will also support long-term data quality.

Troubleshooting Approach

A systematic troubleshooting procedure is followed to maintain system reliability. Issues are first identified through UI messages, log entries, or test failures. The root cause is then analyzed, whether related to user permissions, missing or incorrect field values, automation conflicts, or Apex logic. Required adjustments are made to the affected components, followed by retesting using Apex test classes and manual functional checks. Each issue and its resolution are recorded for documentation, ensuring traceability and supporting future maintenance work.

CONCLUSION

The Salesforce CRM for HandsMen Threads significantly enhanced operational efficiency, improved data consistency, and strengthened customer engagement across the organization. Automated processes, such as Flows, Apex triggers, and scheduled jobs, streamlined order management, inventory updates, customer tracking, and marketing activities, ultimately reducing manual workloads and operational errors. The security framework, supported by profiles, roles, and permission sets, ensured controlled and appropriate access to data, protecting business information while enabling productive collaboration. Custom dashboards and reports provided real-time visibility into performance metrics, supporting faster and more informed decision-making. Overall, the CRM solution not only optimized daily workflows but also established a reliable foundation for long-term growth and strategic development.

RECOMMENDATIONS

1. **Integrate SMS and WhatsApp Messaging** - Implement SMS or WhatsApp notifications using Salesforce Digital Engagement. This allows automatic text alerts for order updates, delivery status, promotions, and loyalty rewards—enhancing customer communication beyond email.
2. **Adopt Agentforce for Intelligent Assistance** - Enable Agentforce (Salesforce's AI assistant) to help users quickly access customer data, generate summaries, provide inventory insights, and guide new employees through processes. This will improve productivity and reduce training time.
3. **Use Einstein for Predictive Insights** - Leverage Einstein Prediction Builder or Next Best Action to forecast sales demand, identify high-value customers, and recommend personalized marketing strategies.
4. **Enable Omni-Channel Support** - Integrate live chat, social media messaging, and phone support into Omni-Channel to centralize customer service operations and ensure faster response times.
